

Suction Hose Round Thread Couplings

These couplings are used to connect together suction hoses. Hoses are fitted to the coupling halves by sliding them over the tails and clamping by means of external clips. Double-serrated and multi-serrated tails are available.

The standard B.S.336 female swivel section is captive on the tail section but a cheaper drop through design is produced with a non-captive swivel, which can be withdrawn over the tail section.

Protruding pin lugs on both halves are used for tightening the couplings, using wrenches.

MATERIAL

Light Alloy
Anodised Aluminium
Polypropylene
Gun Metal

SIZES

4 inch and 5.5 inch as standard with other sizes available on request. Blanking caps and plugs available in all sizes.

WRENCHES

RHL can supply wrenches to help fix and remove all suction hose strainers and coupling systems.
