

## Suction Hose Strainers

### LOW LEVEL OR SLIPPER STRAINER

For use in shallow water the aluminium slipper strainer with stainless steel mesh is used. Suction round thread connection to B.S.336 1965. This type of strainer can only be used where the bottom of the reservoir is solid.

### BASKET STRAINER WITH NON RETURN VALVE

Available with and without non-return valve and drain arrangements. We recommend suction strainers with non-return valve and drain arrangement in order to prevent discontinuities in the liquid column when the suction process is interrupted and makes it possible to fill the suction pipe run. Pulling the rope of the drain arrangement causes the check valve to open and drain the suction hose.

### CYLINDRICAL STRAINER

All aluminium cylindrical strainers are produced in a range of sizes with standard fixed female suction round thread connections to B.S.336 1965, (other threads may be produced if required). Strainers with an integral clack type non-return foot valve are also available.

### BASKET STRAINER

The baskets are fitted over the cylindrical strainers to act as primary filters when the water supply contains weeds.

Standard connection 4 inch or 5.5 inch round thread. Other connection types available.
